

How to use contextual alternatives

Balham to Brooklyn uses contextual alternatives to make it look handwritten. Without it the font will not look right.

Photoshop

First open up the **Character tool panel** (see the example). Type your text, select it and click the contextual alternatives button (circled in red). This will enable the alternative characters.

Note: sometimes in photoshop you have to click it twice.

Illustrator

Choose **OpenType** from the Character panel menu **Window/type/OpenType**. Click the contextual alternatives button (circled in red). You should now see the text change to the contextual alternatives.

InDesign

Choose **OpenType** from the **Character panel menu**, and then select an OpenType attribute.

Other applications

Other applications should support OpenType contextual alternatives.
